"Characterization of a high-affinity binding site for the pea albumin
lb entomotoxin in the weevil Sitophilus.";
Eur. J. Blochem. 270:2429-2435(2003).
-!- FUNCTION: PAlb binds to basic 7S globulin (BG) and stimulates its
posphorylation activity. Involved in the signal transduction
system to regulate the growth and differentiation as a hormone
peptide (By similarity). Toxic to various insects through binding
to a high affinity binding site in the insect gut.
-!- PTM: The C-terminal glycine may be removed from PAlb.
-!- PTM: PAlb displays a cysteine-Knot (knottin) fold.

Albumin 1 D precureor (PAI D) (PsaAlbot2) [Contains: Albumin 1 D chain b (Raingulin D); Albumin 1 D chain activum (Garden pea).
Bigum sativum (Garden pea).
                                                                                                                                                                                                                                                                                                                               embryonic axes of mature seeds.
DEVELOPMENTAL STAGE: Increasing expression during seed development
followed by a rapid degradation during the first days of seed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        germination.

PTM: The Cterminal glycine may be removed from PAlb.

MISCELLANBOUS: The protein sequenced in Ref.2 was probably a mixture of the products of genes C and D, PAlb being of C origin while PAla is of D origin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ing, Plant toxin; Seed storage protein; Signal.

-!- FUNCTION: PALD binds to basic 7S globulin (BG) and stimulates its
phosphorylation activity. Involved in the signal transduction
system to regulate the growth and differentiation as a hormone
peptide. Toxic to various insects through binding to a high
affinity binding site in the insect gut (By similarity).
-!- PTM: The C-terminal glycine may be removed from PAlb.

POSPORTION: PAID binds to basic 78 globulin (BG) and stimulates its phosphorylation activity. Involved in the signal transduction system to regulate the growth and differentiation as a hormone peptide. Toxicus insects through binding to a high affinity binding site in the insect gut (By similarity).

C -- TISSUE SPECIFICITY: Major comopnent of both the cotyledons and embryonic axes of mature seeds.

C -- DBVELOPMENTAL STAGE: Increasing expression during seed development followed by a rapid degradation during the first days of seed
                                                                                                                                                                                                                                                                                                                 STRAIN=CV. J. Biol. Chem. 261:11124-11130(1986)

-! PUNCTION: PAID binds to basic 78 globulin (BG) and stimulates its phosphorylation activity. Involved in the signal transduction system to regulate the growth and differentiation as a hormone peptide. Toxic to various insects through binding to a high affinity binding site in the insect gut (By similarity).

-! TISSUE SPECIFICITY: Major component of both the cotyledons and embryonic axes of mature seeds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SEQUENCE FROM N.A.

                                                                                                                                                                                                                                                                                                                                        PIM: The C-terminal glycine may be removed from PAlb. MISCELLANBOUS: The protest sequenced in Ref.2 was probably a mixture of the products of genes C and D, PAlb being of C origin while PAla is of Dorigin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

C; Complex: Laminins are trimers of an alpha-type abenert membrane proteins to promote C; Function:
A; Description: interact with cells and with other basement membrane proteins to promote C; Superfamily: laminin beta-1 chain; laminin-type EGF-like homology
C; Reywords: basement membrane; calcium binding; cell binding; coiled coil; extracellular
C; Superfamily: laminin beta-2 chain #status predicted <NAT>

small cysteine-rich envelope protein envA precursor - Chlamydophila psittaci
C;Species: Chlamydophila psittaci, Chlamydia psittaci
C;Species: Chlamydophila psittaci, Chlamydia psittaci
C;Date: 21-Feb-1992 #sequence_revision 21-Feb-1992 #text_change 09-Jul-2004
C;Accession: A39499
R;Everett, K.D.E.; Hatch, T.P.
J. Bacteriol. 173, 3821-3830, 1991
A;Title: Sequence analysis and lipid modification of the cysteine-rich envelope proteins
A;Reference number: A39439
A;Accession: A39439
A;Accession: A39439
A;Statuse: preliminary
A;Molecule type: DNA
A;Residuse: 1-87 cEVE>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A;Cross-references: UNIPROT:P27606; GB:M61116; NID:g144489; PIDN:AAB61618.1; PID:g14490

Sequence 20537, Application US/09252991A

Patent No. 6551795

GENERAL INFORMATION:

JERUS OF INVENTION: MUCLEIC ACID ANINO ACID SEQUENCES RELATING TO PSEUDOMONAS

TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

TITLE OF INVENTION: ABRUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

TITLE OF INVENTION: ABRUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

CURRENT APPLICATION NUMBER: US/09/252,991A

CURRENT FILING DATE: 1999-02-18

PRIOR FILING DATE: 1998-02-18

PRIOR FILING DATE: 1998-07-27

NUMBER OF SEQ ID NOS: 33142

LENGTH: 210
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

GENERAL INFORMATION:
APPLICANT: Marc J. Rubenfield et al.
APPLICANT: Marc J. Rubenfield et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: ABEUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: 107196.136
CURRENT APPLICATION NUMBER: US 60/074,788
PRIOR PILING DATE: 1998-02-18
PRIOR FILING DATE: 1998-02-18
PRIOR FILING DATE: 1998-07-27
NUMBER OF SEQ ID NOS: 33142
SEQ ID NO 17204
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              <u>ښ</u>
